

SANJAY SHAH

Senior Software Engineer · Java, Spring Boot, Kafka, PostgreSQL, Cloud & Identity

Kathmandu, Nepal · +977 986 327 4892 · messanjayshah@gmail.com · sanjayshah.com.np · linkedin.com/in/mesanjay · github.com/mesanjayshah · credly.com/users/sanjay-shah.861076ff

PROFESSIONAL SUMMARY

Senior Software Engineer who solves hard backend problems and delivers — secure, compliant, built to last. Seven years across healthcare platforms, identity and access management, and multi-tenant SaaS. Security is built in from day one (data isolated per customer, sensitive fields encrypted, every change scanned before it ships); regulation is treated as a requirement (versioned rules, tamper-evident audit trails, access to health data logged); and new tools are adopted early but deliberately — Java 25 with virtual threads, Spring Boot 4, Kafka, Kubernetes with Argo CD, Terraform, Playwright, Semgrep and Trivy, and AI-assisted engineering with Claude Code, MCP servers and multi-agent workflows.

At a glance: seeking senior backend, platform or security-minded engineering roles · core stack Java 25, Spring Boot, Kafka, PostgreSQL, Kubernetes, Terraform · domains healthcare platforms, identity & access, multi-tenant SaaS · Kathmandu, Nepal, remote OK · four verified certifications (Credly).

Patterns solved: (1) Tenant isolation that fails closed — the database refuses cross-tenant reads, so a wrong tenant gets 404 even if application code is wrong (independent build; education SaaS). (2) Identity federation and zero-downtime migration — several identity providers behind one sign-on layer; users moved to a cloud provider over SCIM with no re-onboarding (IAM role). (3) Reliable event-driven integration — transactional outbox to Kafka to idempotent consumers; duplicates absorbed, order preserved (independent build).

1 · Deliver the solution Own the problem end to end and ship a working, verified result — not just code.	2 · Security Built in from day one: data isolated per customer, sensitive fields encrypted, every change scanned before it ships.	3 · Compliance Regulation treated as a requirement: rules versioned, audit trails tamper-evident, access to health data logged.	4 · Future-proof New tools adopted early but deliberately — Java 25, GitOps, AI coding agents — on designs that survive retries and replays.

WORK EXPERIENCE

Senior Software Engineer

Nov 2025 – Present

Healthcare software

- Builds and enhances healthcare systems on Java and Spring Boot with cloud-native services, with an emphasis on reliability.
- Applies secure-coding and data-protection practices to the handling of sensitive patient information.
- Uses AI-assisted engineering workflows for development, code review and testing.

Senior Software Engineer

Aug 2022 – Nov 2025

Identity & access management for enterprise clients (US and Europe)

- Designed and built custom SCIM 2.0 connectors and a bulk migration tool, moving identities from a self-hosted Keycloak to Okta securely and without onboarding delays.
- Delivered identity federation, SSO and platform upgrades on OIDC, SAML and OAuth 2.0 for enterprise clients in sports media and banking, with Okta, Auth0 and Spring Boot across multi-tenant application estates.
- Modernised legacy IAM connector codebases for performance and maintainability; introduced Checkmarx static analysis into the pipeline to enforce secure development.
- Built an internal pre-sales estimation tool (Spring Boot, React) that improved estimate accuracy for enterprise deployments.
- Earned three Okta certifications; mentored engineers on identity standards and secure-by-default integration.

Full Stack Software Developer

Aug 2019 – Feb 2022

Multi-tenant SaaS ERP for education

- Designed and developed HR & Payroll, CRM, CMS and Online Examination modules (React, Spring Boot, PostgreSQL, MySQL).

- Led the re-architecture of the CRM module for usability, maintainability and scale; delivered a 25% performance gain on hot paths.
- Migrated a monolith to a modular Maven/Gradle build and containerised it with Docker on AWS EC2, cutting manual deployment time.
- Contributed to the SaaS foundation redesign, strengthening multi-tenancy and onboarding of new institutions.

INDEPENDENT PROJECT

Multi-tenant healthcare & enterprise ERP platform — designed and built independently Ongoing
Personal project; no name, repository or customers disclosed by design

- Monolith being extracted into services on Java 25 (virtual threads) and Spring Boot 4; Kafka with a transactional outbox and idempotent consumers; absolute values on the wire.
- Customer isolation enforced by PostgreSQL row-level security with a two-role model; cross-tenant lookups answer 404; field-level encryption, PHI access logging, hash-chained financial audit trail.
- GitOps on Kubernetes with Helm and Argo CD, Terraform infrastructure; shift-left security pipeline every service inherits (Semgrep, Trivy, gitleaks, Checkov, Cosign, SBOM); Playwright end-to-end gate for every form; ArchUnit rules that fail the build.
- AI-assisted multi-agent development with Claude Code and MCP servers; engineering rules kept in the repository; agent work verified by the build, the E2E suite and a live browser.

Public reference demos on github.com/mesanjayshah: database-per-tenant multi-tenancy, OIDC and SAML single sign-on with Okta, Okta-hosted login (authorization-code flow), a patient microservice with CI and Docker, RabbitMQ messaging.

SKILLS

Languages	Java 8 → 25 (records, sealed types, virtual threads), SQL, TypeScript, JavaScript
Frameworks	Spring Boot, Spring Security, Hibernate/JPA, React, Thymeleaf, Tailwind CSS, HTMX, Alpine.js
Architecture	Microservices & service extraction, multi-tenancy, event-driven (Kafka, transactional outbox, idempotent consumers), REST
Data	PostgreSQL (row-level security, two-role model), Flyway, Redis, Testcontainers, MySQL, MongoDB
Cloud & DevOps	AWS (EC2, RDS, ECR, S3, CloudFront, SSM), Docker, Kubernetes (k3s), Helm, Argo CD (GitOps), Terraform/OpenTofu, GitHub Actions, Jenkins, Prometheus/CloudWatch
IAM & Security	OAuth 2.0, OIDC, SAML 2.0, SCIM 2.0, JWT, LDAP, Okta, Auth0, Keycloak, field-level encryption, PII/PHI handling
DevSecOps	Semgrep (custom rules), Trivy, gitleaks, Checkov, Kubescape, Cosign, CycloneDX SBOM, OWASP ZAP, Checkmarx, SonarQube
Testing	Playwright (E2E), JUnit 5, Mockito, Testcontainers, ArchUnit, MockMvc
AI-assisted	Claude Code, MCP servers, multi-agent workflows, agent guidance in the repo, token-discipline skills, agent-written tests verified in a live browser

EDUCATION

- Master of Computer Science — pursuing
- Bachelor of Science in Computer Science — 2015 – 2019

CERTIFICATIONS

- Okta Certified Developer, Customer Identity Cloud — 2024
- Okta Certified Consultant — 2023
- Okta Certified Developer, Workforce Identity Cloud — 2023
- Web Security & Access Management: JWT, OAuth 2.0, OIDC — 2022

Employers and clients are described by domain.
